

## Merit+ Circle Geometry Practice #6

1. Find  $\angle OAD$  (marked  $\theta$ ).

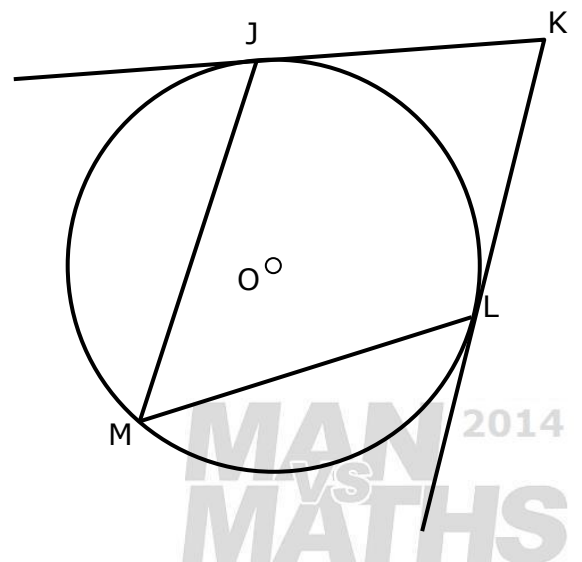

2. PQ is a tangent to the circle.  
Find  $\angle PQR$  (marked  $\theta$ ).

3. Lengths  $WX = WY = YZ$ .  
Show that WZ is parallel to XY.

4. JK and KL are tangents intersecting at J and L.  
How large is  $\angle JKL$ , in terms of  $\angle JML$ .

## Answers: Merit+ Circle Geometry Practice #6

1. Find  $\angle OAD$  (marked  $\theta$ ).

$\angle ABO = \angle BAO$  (triangle formed by radii is isosceles)  
 $\angle ABO = 40^\circ$  (interior angles of a triangle add to  $180^\circ$ )  
 $\angle BAD = 50^\circ$  (opposite angles cyclic quad add to  $180^\circ$ )  
 $\angle OAD = 10^\circ$  (remainder when  $\angle BAO$  taken from  $\angle BAD$ )

2. PQ is a tangent to the circle.  
Find  $\angle PQR$  (marked  $\theta$ ).

$\angle STR = 35^\circ$  (angles from same arc to edge are equal)  
 $\angle PRT = 35^\circ$  (interior angles of a triangle add to  $180^\circ$ )  
 $\angle RPQ = 90^\circ$  (tangent and radius are at  $90^\circ$ )  
 $\angle PQR = 55^\circ$  (interior angles of a triangle add to  $180^\circ$ )

or calculate  $\angle POS$  using isosceles  $\Delta$   
 then vertically opposite =  $\angle ROT$   
 calculate  $\angle ORT$  using isosceles  $\Delta$  etc

3. Lengths  $WX = WY = YZ$ .  
Show that WZ is parallel to XY

Radii make three identical triangles (same base length and same sides = all identical angles too).

Let  $\angle WXO = \theta$ , from which all same size are shown.

$\angle WZY = 180^\circ - 2\theta$  (opposite angles in cyclic quad add to  $180^\circ$ )

$\angle XYZ = 2\theta$  so  $\angle XYZ + \angle WZY = 180^\circ$

Angles  $\angle XYZ$  and  $\angle WZY$  are co-interior and add to  $180^\circ$   
 $\Rightarrow$  WZ and XY must be parallel.

4. JK and KL are tangents intersecting at J and L.  
How large is  $\angle JKL$ , in terms of  $\angle JML$ .

Let  $\angle JML = x$

$\angle JOL = 2x$  (angle at centre is twice angle at edge from same arc)

$\angle KJO = \angle KLO = 90^\circ$  (both tangents to radii)

$\angle JKL = 180 - 2x$  (interior angles quadrilateral add to  $360^\circ$ )

$\angle JKL = 180 - 2 \times \angle JML$
